Test Summary

1. Testing Performed

I tested the AbleSpace website on Google Chrome and Microsoft Edge using Windows 11. I checked login, adding students, editing student details, search, form validation, logout, reports, and other app features. I also checked the mobile view using Chrome DevTools with a screen size of 390 × 844 pixels. I tested whether the website worked properly and whether buttons and forms worked as expected.

2. Issues Found

I found **5 bugs** during testing:

1. Student form data was lost when I refreshed the page without saving.
2. Some student table columns and names were cut off on mobile view.
3. Accommodation Tracker showed an authentication error.
4. IEP System showed a blank page because its URL was not set.
5. Combined reports downloaded successfully but did not appear in Print History.

I would fix the IEP System and Accommodation Tracker issues first because users cannot open these apps. After that, I would fix the mobile table issue and the missing report history.

3. Areas Not Tested

I did not test Firefox or a real mobile phone. I also did not test website speed with many users, automated testing, or all security features. I skipped these tests because I focused on the main features and had limited time. I did not test payment features.

4. What I Would Test Next

If I had another 1–2 hours, I would check all five bugs again to confirm that they happen every time. I would test the IEP System and Accommodation Tracker after fixing their issues. I would also check whether combined reports appear in Print History, test the student table on different screen sizes, and test the website on Firefox. Finally, I would check what happens when users leave a form without saving. These tests would help make sure the website works properly and is easy to use.
